

# Phys 132

# HW VI-VII

1) Sketch force on pos test charge at various locations

a)

Notice  $F$  is strong right in between charges

b)

Notice  $F$  is weak right in between charges

$$2) F = \frac{q_1 q_2}{4\pi\epsilon_0 r^2} = \frac{-10^{-3} \cdot 10^{-3}}{4\pi(8.85 \times 10^{-12})(.01)^2} \text{ N} = \boxed{9 \times 10^7 \text{ N}}$$

$$m_{\text{equiv}} = \frac{F}{g} = \frac{9 \times 10^7 \text{ N}}{10 \text{ m/s}^2} = \boxed{9 \times 10^6 \text{ kg}}$$

Really big!

These forces are manageable because capacitors involve very large areas, so pressure on separating (insulating) material is negligible. In class, we saw forces between nano coulombs of charge.

3)

$$F=0, \text{ so } \frac{-\cancel{q}/4}{4\pi\epsilon_0(1\text{cm})^2} = \frac{-q}{4\pi\epsilon_0(x)^2}$$

$$\text{or } 4 \cdot (1\text{cm})^2 = x^2 \quad (\text{by inverting \& canceling like terms})$$

$$x = \sqrt{4(1\text{cm})^2} = \boxed{2\text{cm}}$$

4)

~~Ques~~ We must add  $\vec{E}$ 's as vectors —  $\vec{E}$  from the + charge ( $\vec{E}_+$ ) and  $\vec{E}$  from the - charge ( $\vec{E}_-$ ). This problem makes solution by components easy, since  $E_x = -|E_-|$  and  $E_y = |E_+|$

$$\text{So } E_x = -\frac{q}{4\pi\epsilon_0(1\text{m})^2} = -\frac{2 \times 10^{-6} \text{ C}}{4\pi(8.85 \times 10^{-12})(1\text{m})^2}$$

~~$\approx 1.79 \times 10^6 \text{ N/C}$~~   
 ~~$\approx 1.79 \times 10^6 \text{ N/C}$~~   
 $-1.79 \times 10^6 \text{ N/C}$

$$E_+ = E_- = \frac{10^{-6} \text{ C}}{4\pi (8.85 \times 10^{-12}) (1 \text{ m})^2} = \cancel{\text{unphysical}} \quad 9 \times 10^5 \text{ N/C}$$

$$5) \quad F_{\text{grav}} = \frac{G m_1 m_2}{r^2}$$

$$G = 6.67 \times 10^{-11} \frac{\text{Nm}^2}{\text{kg}^2}$$

$$F_{\text{elec}} = \frac{q_1 q_2}{4\pi \epsilon_0 r^2}$$

$$\epsilon_0 = 8.85 \times 10^{-12} \frac{\text{C}^2}{\text{Nm}^2}$$

$$\frac{F_{\text{elec}}}{F_{\text{grav}}} = \left( \frac{q_1 q_2}{4\pi \epsilon_0 r^2} \right) \left( \frac{r^2}{G m_1 m_2} \right) = \left( \frac{q}{m} \right)^2 \left( \frac{1}{4\pi \epsilon_0 G} \right)$$

$$\begin{aligned} &\text{if } q_1 = q_2 \\ &\text{ \& } m_1 = m_2 \end{aligned}$$

Notice  $r$ 's vanish, since both forces are  $1/r^2$  dependence.  
For the proton,  $m = 1.67 \times 10^{-27} \text{ kg}$ ,  $q = 1.6 \times 10^{-19} \text{ C}$ , so

$$\frac{F_{\text{elec}}}{F_{\text{grav}}} = \left( \frac{1.6 \times 10^{-19} \text{ C}}{1.67 \times 10^{-27} \text{ kg}} \right)^2 \frac{1}{4\pi (8.85 \times 10^{-12} \frac{\text{C}^2}{\text{Nm}^2}) (6.67 \times 10^{-11} \frac{\text{Nm}^2}{\text{kg}^2})}$$

$$= 1.2 \times 10^{36} \quad \Leftarrow \text{phenomenal!}$$

It is no surprise one can neglect gravitational effects in atoms & molecules!
